

ABSTRACT

An apparatus for cleaning a spraying end of a paint sprayer includes a solvent vessel having an opening and containing a solvent. The opening is configured to receive the spraying end of the paint sprayer. A rotatable brush is only partially submerged in the solvent such that the spraying end contacts the brush when inserted into the opening. A motor is interconnected with and provides rotation to the brush. A signal generator is operable to provide an actuation signal that activates the motor such that the brush rotates and cleans paint from the spraying end of the paint gun.
